Patent Pending

With PerkAlert™ providing similar capabilities to having a technician on site opens many new opportunities to improve existing operational processes. PerkAlert™ provides the opportunity to incorporate new capabilities not possible yesterday.

PerkAlert™ provides remote access to the information required to manage gourmet coffee operations over multiple location.

This capability can reduce maintenance costs, improve quality control, enhance brand image, and facilitate rapid response to new recipes.

The Perk Alert™ software accepts usage data, error messages, and alerts from the Super Automatic. The PerkAlert™ software can also query current brewing recipes and machine settings and then adjust settings according to parameters provided locally or from a remote location. These functions will provide roasters, maintenance organizations, restaurants, coffee and managed services organizations the control needed to maintain an efficient quality gourmet coffee operation regardless of outlet locations.

Reduced Maintenance Costs

The ability to access current real time usage data, messages, and alerts will allow technicians to be more knowledgeable about the current status of a machine prior to being onsite. Possible failing parts can be identified and repaired before a failure occurs. The ability to read current settings remotely and make adjustments may eliminate some onsite technicians visits.

Improved Quality Control and Improve Brand Image

Alerts and messages can be distributed by operators, management, head baristas, and maintenance providers instantly. Alerts can escalate as abnormal conditions remain uncorrected.

Rapid Distribution of New Recipes

New recipes can be distributed in mass to multiple locations and adjustments made by machine to accommodate for machine and location variations. New drinks, adjustments in dosage, brewing time and other parameters can be set from a central location by a head barista.

Segment Focus:

- Roasters
- Maintenance providers
- Managed services organizations
- Chain restaurants
